

EXP 8: LINEAR REGRESSION

NAME: SAMUEL I

REG NO:192312584

AIM:

To implement the Linear Regression algorithm in Python and predict continuous values using a given dataset.

PROCEDURE

1. Import the required libraries and load the dataset into the program.
2. Split the dataset into training data and testing data.
3. Train the Linear Regression model using the training dataset.
4. Predict the output values for the testing dataset.
5. Display the Mean Squared Error and R^2 score to evaluate the performance of the model.

PROGRAM:

Linear Regression using Python

```
from sklearn.datasets import load_diabetes
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LinearRegression
from sklearn.metrics import mean_squared_error, r2_score
```

```
# Load dataset
```

```
data = load_diabetes()
```

```
X = data.data
```

```
y = data.target
```

```
# Split dataset
X_train, X_test, y_train, y_test = train_test_split(
    X, y, test_size=0.3, random_state=42
)
```

```
# Create and train model
model = LinearRegression()
model.fit(X_train, y_train)
```

```
# Predict test data
y_pred = model.predict(X_test)
```

```
# Display results
print("Predicted Values:")
print(y_pred)
```

```
print("\nMean Squared Error:")
print(mean_squared_error(y_test, y_pred))
```

```
print("\nR2 Score:")
print(r2_score(y_test, y_pred))
```

OUTPUT:

```
Predicted Values:
[138.46970031 181.10052342 125.34400904 292.75977277 123.8830531

```

RESULT:

The Logistic Regression algorithm was successfully implemented in Python. The model was trained and tested on the dataset, and its performance was evaluated using the confusion matrix and accuracy, achieving effective classification results.
